

3-Pin Microprocessor Reset Circuits

General Description

The MAX803/MAX809/MAX810 are microprocessor (μP) supervisory circuits used to monitor the power supplies in μP and digital systems. They provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with +5V, +3.3V, +3.0V, or +2.5V powered circuits.

These circuits perform a single function: they assert a reset signal whenever the V_{CC} supply voltage declines below a preset threshold, keeping it asserted for at least 140ms after V_{CC} has risen above the reset threshold. Reset thresholds suitable for operation with a variety of supply voltages are available.

The MAX803 has an open-drain output stage, while the MAX809/MAX810 have push-pull outputs. The MAX803's open-drain $\overline{\text{RESET}}$ output requires a pull-up resistor that can be connected to a voltage higher than V_{CC} . The MAX803/MAX809 have an active-low $\overline{\text{RESET}}$ output, while the MAX810 has an active-high RESET output. The reset comparator is designed to ignore fast transients on V_{CC} , and the outputs are guaranteed to be in the correct logic state for V_{CC} down to 1V.

Low supply current makes the MAX803/MAX809/MAX810 ideal for use in portable equipment. The MAX803 is available in a 3-pin SC70 package, and the MAX809/MAX810 are available in 3-pin SC70 or SOT23 packages.

Applications

Computers
 Controllers
 Intelligent Instruments
 Critical μP and μC Power Monitoring
 Portable/Battery-Powered Equipment
 Automotive

Typical Operating Circuit

Features

- ◆ Precision Monitoring of +2.5V, +3V, +3.3V, and +5V Power-Supply Voltages
- ◆ Fully Specified Over Temperature
- ◆ Available in Three Output Configurations
 - Open-Drain $\overline{\text{RESET}}$ Output (MAX803)
 - Push-Pull $\overline{\text{RESET}}$ Output (MAX809)
 - Push-Pull RESET Output (MAX810)
- ◆ 140ms min Power-On Reset Pulse Width
- ◆ 12 μA Supply Current
- ◆ Guaranteed Reset Valid to $V_{\text{CC}} = +1\text{V}$
- ◆ Power Supply Transient Immunity
- ◆ No External Components
- ◆ 3-Pin SC70 and SOT23 Packages

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX803_EXR-T	-40°C to +125°C	3 SC70-3
MAX803_EXR-T10	-40°C to +125°C	3 SC70-3
MAX809_EXR-T	-40°C to +125°C	3 SC70-3
MAX809_EXR-T10	-40°C to +125°C	3 SC70-3

MAX810_EUR-T10	-40°C to +105°C	3 SOT23-3

Note: These parts are offered in 2.5k or 10k reels, and must be ordered in 2.5k or 10k increments. Order MAX803_EXR-T for 2.5k reels and MAX803_EXR-T10 for 10k reels. Insert the desired suffix letter from the Selector Guide into the blank to complete the part number. All versions of these products may not be available at the time of announcement. Contact factory for availability.

Pin Configuration

3-Pin Microprocessor Reset Circuits

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)		Continuous Power Dissipation (T _A = +70°C)
V _{CC}	-0.3V to +6.0V	3-Pin SC70 (derate 2.17mW/°C above +70°C).....
RESET, $\overline{\text{RESET}}$ (push-pull)	-0.3V to (V _{CC} + 0.3V)	3-Pin SOT23 (derate 4mW/°C above +70°C).....
$\overline{\text{RESET}}$ (open drain)	-0.3V to +6.0V	Operating Temperature Range
Input Current, V _{CC}	20mA	3-Pin SC70
Output Current, RESET, $\overline{\text{RESET}}$	20mA	3-Pin SOT23.....
Rate of Rise, V _{CC}	100V/μs	Storage Temperature Range
		Lead Temperature (soldering, 10s)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = full range, T_A = -40°C to +105°C (SOT23) or T_A = -40°C to +125°C (SC70), unless otherwise noted. Typical values are at T_A = +25°C, V_{CC} = 5V for L/M/J versions, V_{CC} = 3.3V for T/S versions, V_{CC} = 3V for R version, and V_{CC} = 2.5V for Z version.) (Note 1)

Detailed Description

A microprocessor's (μP 's) reset input starts the μP in a known state. The MAX803/MAX809/MAX810 assert reset to prevent code-execution errors during power-up, power-down, or brownout conditions. They assert a reset signal whenever the V_{CC} supply voltage declines below a preset threshold, keeping it asserted for at least 140ms after V_{CC} has risen above the reset threshold. The MAX803 uses an open-drain output, and the MAX809/MAX810 have a push-pull output stage. Connect a pull-up resistor on the MAX803's RESET output to any supply between 0 and 6V.

Pin Description

PIN	NAME	FUNCTION
1	GND	Ground
2	RESET (MAX803/MAX809)	RESET Output remains low while V_{CC} is below the reset threshold, and for at least 140ms after V_{CC} rises above the reset threshold.
	RESET (MAX810)	RESET Output remains high while V_{CC} is below the reset threshold, and for at least 140ms after V_{CC} rises above the reset threshold.
3	V_{CC}	Supply Voltage (+5V, +3.3V, +3.0V, or +2.5V)

Applications Information

Negative-Going V_{CC} Transients

In addition to issuing a reset to the μP during power-up, power-down, and brownout conditions, the MAX803/MAX809/MAX810 are relatively immune to short-duration negative-going V_{CC} transients (glitches).

Figure 1 shows typical transient duration vs. reset comparator overdrive, for which the MAX803/MAX809/MAX810 do **not** generate a reset pulse. The graph was generated using a negative-going pulse applied to V_{CC} , starting 0.5V above the actual reset threshold and ending below it by the magnitude indicated (reset comparator overdrive). The graph indicates the maximum pulse width a negative-going V_{CC} transient can have without causing a reset pulse. As the magnitude of the transient increases (goes farther below the reset threshold), the maximum allowable pulse width decreases. Typically, for the MAX8__L and MAX8__M, a V_{CC} transient that goes 100mV below the reset threshold and lasts 20 μs or less will not cause a reset pulse. A 0.1 μF bypass capacitor mounted as close as possible to the V_{CC} pin provides additional transient immunity.

Ensuring a Valid Reset Output Down to $V_{\text{CC}} = 0$

When V_{CC} falls below 1V, the MAX809 RESET output no longer sinks current—it becomes an open circuit.

3-Pin Microprocessor Reset Circuits

Therefore, high-impedance CMOS logic inputs connected to $\overline{\text{RESET}}$ can drift to undetermined voltages. This presents no problem in most applications since most μP and other circuitry is inoperative with V_{CC} below 1V. However, in applications where $\overline{\text{RESET}}$ must be valid down to 0V, adding a pull-down resistor to $\overline{\text{RESET}}$ causes any stray leakage currents to flow to ground, holding $\overline{\text{RESET}}$ low (Figure 2). R1's value is not critical; 100k Ω is large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground.

A 100k Ω pull-up resistor to V_{CC} is also recommended for the MAX810 if $\overline{\text{RESET}}$ is required to remain valid for $V_{\text{CC}} < 1\text{V}$.

Figure 1. Maximum Transient Duration Without Causing a Reset Pulse vs. Reset Comparator Overdrive

Figure 3. Interfacing to μPs with Bidirectional Reset I/O

Interfacing to μPs with Bidirectional Reset Pins

Since the $\overline{\text{RESET}}$ output on the MAX803 is open drain, this device interfaces easily with μPs that have bidirectional reset pins, such as the Motorola 68HC11. Connecting the μP supervisor's $\overline{\text{RESET}}$ output directly to the microcontroller's (μC 's) $\overline{\text{RESET}}$ pin with a single pull-up resistor allows either device to assert reset (Figure 3).

MAX803 Open-Drain $\overline{\text{RESET}}$ Output Allows Use with Multiple Supplies

Generally, the pull-up connected to the MAX803 will connect to the supply voltage that is being monitored at the IC's V_{CC} pin. However, some systems may use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 4). Note that as the MAX803's V_{CC} decreases

Figure 2. $\overline{\text{RESET}}$ Valid to $V_{\text{CC}} = \text{Ground}$ Circuit

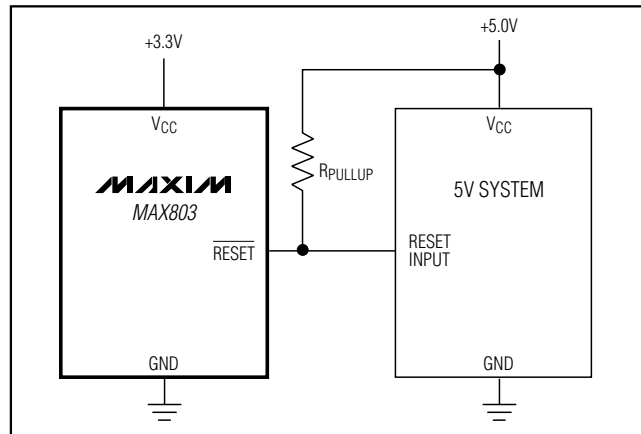

Figure 4. MAX803 Open-Drain $\overline{\text{RESET}}$ Output Allows Use with Multiple Supplies

3-Pin Microprocessor Reset Circuits

below 1V, so does the IC's ability to sink current at $\overline{\text{RESET}}$. Also, with any pull-up, $\overline{\text{RESET}}$ will be pulled high as V_{CC} decays toward 0. The voltage where this occurs depends on the pull-up resistor value and the voltage to which it is connected.

The MAX8__L/T/Z use highly accurate circuitry to ensure that reset is asserted close to the 5% limit, and long before the supply has declined to 10% below nominal.

Benefits of Highly Accurate Reset Threshold

Most μP supervisor ICs have reset threshold voltages between 5% and 10% below the value of nominal supply voltages. This ensures a reset will **not** occur within 5% of the nominal supply, but **will** occur when the supply is 10% below nominal.

When using ICs rated at only the nominal supply $\pm 5\%$, this leaves a zone of uncertainty where the supply is between 5% and 10% low, and where the reset may or may not be asserted.
