**Linear Regulator** 

The MP20051 is a low-dropout linear regulator

that supplies up to 1A current with a 140mV

dropout voltage. The externally-adjustable output

voltage has a range of 0.8V to 5V from an input

An internal PMOS pass element allows for a low

110µA ground current, making the MP20051

suitable for battery-powered devices. Other

features include low-power shutdown, and short-

circuit and thermal protection. The MP20051 is

available in 3mm x 3mm 8-pin QFN and SOIC8E

DESCRIPTION

voltage of 2.5V to 5.5V.

packages.

## **FEATURES**

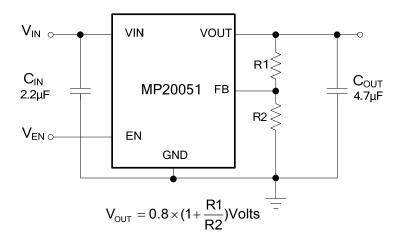

- Up to 1A Output Current
- Low 140mV Dropout at 1A
- Low 110µA Ground Current
- Output Voltage Available from 0.8V to 5V
- Low Noise: 13μV<sub>RMS</sub> typical (10Hz to 100kHz)
- 63dB PSRR @1kHz
- Stable with Ceramic Capacitor
- Excellent Load/Line Transient Response
- Current Limiting and Thermal Protection
- Available in 3mm x 3mm 8-pin QFN and SOIC8E Packages

## **APPLICATIONS**

- Notebook Computers
- Cordless Telephones
- Cellular Phones
- Wireless Communication Equipment
- Hand-Held Instruments

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

#### 

#### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J$  (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) =  $(T_J$  (MAX)- $T_A$ )/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) Devices are ESD sensitive. Handling precaution recommended.
- The device is not guaranteed to function outside of its operating conditions.
- 5) Measured on JESD51-7, 4-layer PCB.

## **ELECTRICAL CHARACTERISTICS**

V<sub>IN</sub>=V<sub>OUT</sub>+0.5V or V<sub>IN</sub>=2.5V, EN=V<sub>IN</sub>, Typical values are at T<sub>A</sub>=25°C, unless otherwise specified

Parameter	Condition		Min	Тур	Max	Units	
Input Voltage			2.5		5.5	V	
Input Under Voltage Lockout	V <sub>IN</sub> rising	1.95		2.25	V		
Hysteresis of UVLO				160		mV	
FB Voltage	V <sub>OUT</sub> =0.8V, I <sub>OUT</sub> =1mA		0.784	8.0	0.816	V

Thermal Shutdown Temperature	Typical thermal hysteresis	-	150		°C		

6) Dropout Voltage is defined as the input to output differential when the output voltage drops 100mV below its nominal value.

7) Line Regulation= 
$$\frac{\left|V_{OUT[V_{IN(MAX)}]} - V_{OUT[V_{IN(MIN)}]}\right|}{\left[V_{IN(MAX)} - V_{IN(MIN)}\right] \times V_{OUT(NOM)}} \times (\% / V)$$
8) Load Regulation= 
$$\frac{\left|V_{OUT[I_{OUT(MAX)}]} - V_{OUT[I_{OUT(MIN)}]}\right|}{V_{OUT(NOM)}} \times (\%)$$

8) Load Regulation= 
$$\frac{\left|V_{\text{OUT}\left[I_{\text{OUT}\left(\text{MAX}\right)}\right]} - V_{\text{OUT}\left[I_{\text{OUT}\left(\text{MIN}\right)}\right]}\right|}{V_{\text{OUT}\left(\text{NOM}\right)}} \times (\%)$$

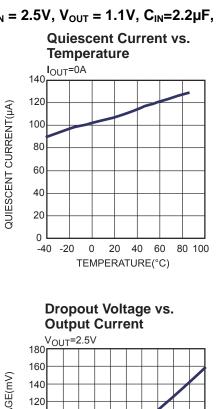

# **PIN FUNCTIONS**

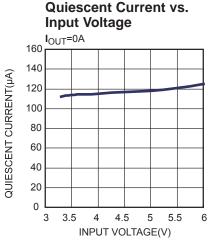

Pin #	Name	Pin Function	
1, 2	VOUT	Regulator output. Bypass with a standard 4.7µF ceramic capacitor to GND. Connect all the pins together externally.	
3	FB	Feedback Input. Connect FB to the center point of the external resistor divider. The feedback threshold voltage is 0.8V.	
4	GND Exposed pad	Ground. Connect exposed pad to GND plane for optimal thermal performance.	
5	EN	Regulator Enable Control Input. Drive EN above 1.5V to turn on the MP20051. Drive EN below 0.4V to turn it off. Do not float the EN pin.	
6	NC	No Connection. Leave this NC pin open.	
7, 8	VIN	Regulator Input. Supply voltage ranges from 2.5V to 5.5V. Bypass with 2.2µF capacitor. These pins must be externally connected for proper operation even if they are internally connected.	

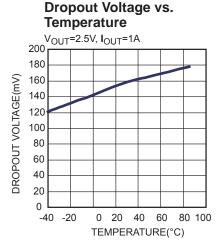

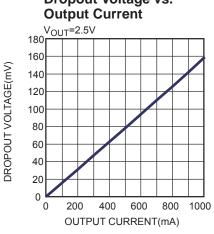

## TYPICAL PERFORMANCE CHARACTERISTICS

 $V_{IN} = 2.5V$ ,  $V_{OUT} = 1.1V$ ,  $C_{IN} = 2.2\mu F$ ,  $C_{OUT} = 4.7\mu F$ ,  $T_A = 25$ °C, unless otherwise noted.

# **FUNCTIONAL BLOCK DIAGRAM**

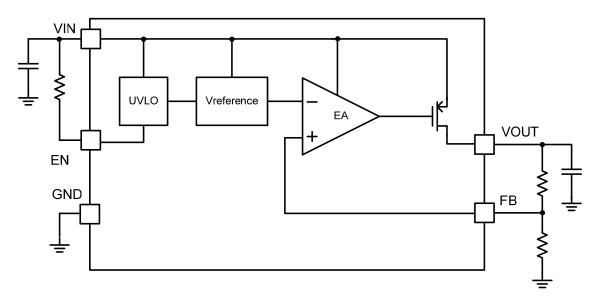

Figure 1—Functional Block Diagram

## **OPERATION**

The MP20051 is a low-dropout linear regulator that can supply up to 1A current, which makes it suitable for very low voltage, low quiescent, low noise, and high PSRR applications such as wireless LAN transceivers, notebook computers, smartphones, and other low-power electronics.

The MP20051 uses an internal PMOS as the pass element and includes both thermal shutdown and an internal current-limiting circuit.

#### **Dropout Voltage**

Dropout voltage is the minimum input to output differential voltage required for the regulator to maintain an output voltage within 100mV of its nominal value. Because the PMOS pass element behaves as a low-value resistor, the dropout voltage of MP20051 is only 140mV.

#### **Shutdown**

The MP20051 can be switched ON or OFF by a logic input at the EN pin: Logic high turns the regulator on and logic low turns it off. Tie the EN pin to VIN if the application does not require the shutdown feature. Do not float the EN pin.

#### **Current Limit**

The MP20051 includes a current limit structure that monitors and controls the PMOS gate voltage to limit the guaranteed maximum output current to 1.6A.

#### **Thermal Protection**

Thermal protection turns off the PMOS when the junction temperature exceeds 150°C, allowing the IC to cool. When the IC's junction temperature drops by 20°C, the PMOS will turn on again. Thermal protection limits total power dissipation in the MP20051. For reliable operation, limit the junction temperature to a maximum of 125°C.

#### **Load-Transient Considerations**

The output response of the load-transient consists of a transient response and DC shift—the MP20051's excellent load regulation effectively limits the DC shift. The output voltage transient depends on the output capacitor's value and ESR. Increasing the capacitance and decreasing the ESR will improve the transient response.

#### **APPLICATION INFORMATION**

## **Setting the Output Voltage**

The MP20051 has an externally-set output voltage with a range of 0.8V to 5V given a 2.5V to 5.5V input. Set the output voltage using a resistive voltage divider from the output voltage to the FB pin. The result of the voltage divider at the FB pin is:

$$V_{FB} = V_{OUT} \, \frac{R2}{R1 + R2}$$

Where  $V_{FB}$  is the feedback threshold voltage ( $V_{FB}$  = 0.8V), and  $V_{OUT}$  is the output voltage. Thus the output voltage is:

$$V_{OUT} = 0.8 \times \frac{R1 + R2}{R2}$$

R2 can go as high as  $100k\Omega$ , but typical applications use  $10k\Omega$ . After selecting R2, R1 is determined by:

$$R1 = R2 \times \left( \frac{V_{OUT} - V_{FB}}{V_{FB}} \right)$$

For example, for a 1.1V output voltage, R2 is  $10k\Omega$ , and R1 is  $3.75k\Omega$ . You can select a standard  $3.75k\Omega$  (±1%) resistor for R1.

#### **Power Dissipation**

The power dissipation for any package depends on the thermal resistance of the case and circuit board, the temperature differential between the junction and ambient air, and the rate of air flow. The power dissipation across the device can be represented by the equation:

$$P = (V_{IN} - V_{OUT}) \times I_{OUT}$$

The allowable power dissipation can be calculated using the following equation:

$$P_{(MAX)} = (T_{Junction} - T_{Ambient}) / \theta_{JA}$$

Where  $(T_{Junction} - T_{Ambient})$  is the temperature differential between the junction and the surrounding environment,  $\theta_{JA}$  is the thermal resistance from the junction to the ambient environment. Connecting the exposed GND pad to a large ground pad or plane helps to channel away heat.

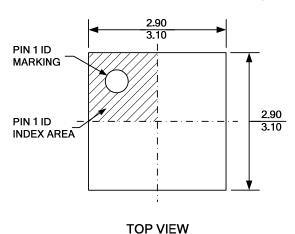

#### **Output Capacitor Selection**

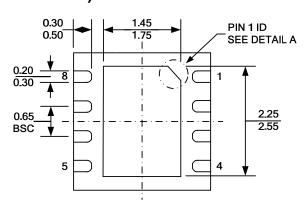

The MP20051 is specifically designed to work with a standard ceramic output capacitor to save space and improve performance. Use a 4.7µF ceramic capacitor for most applications. Larger output capacitors will improve load transient response and reduce noise at the cost of increased size.
