

5-V Low-Drop Fixed Voltage Regulator

TLE 4271-2

Features

- Output voltage tolerance $\leq \pm 2\%$
- Low-drop voltage
- Integrated overtemperature protection
- Reverse polarity protection
- Input voltage up to 42 V
- Overvoltage protection up to 65 V (\leq 400 ms)
- Short-circuit proof
- Suitable for use in automotive electronics
- Wide temperature range
- Adjustable reset and watchdog time

-
P-TO220-7-11
P-TO263-7-1

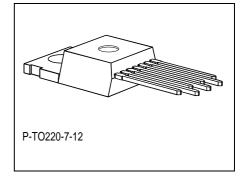

Туре	Ordering Code	Package		
TLE 4271-2	Q67000-A9446	P-TO220-7-11		
TLE 4271-2 S	Q67000-A9448	P-TO220-7-12		
TLE 4271-2 G	Q67006-A9447	P-TO263-7-1		

Functional Description

The TLE 4271-2 is functional and electrical identical to the TLE 4271.

The device is a 5-V low-drop fixed-voltage regulator. The maximum input voltage is 42 V (65 V, \leq 400 ms). Up to an input voltage of 26 V and for an output current up to 550 mA it regulates the output voltage within a

2 % accuracy. The short circuit protection limits the output current of more than 650 mA. The IC can be switched off via the inhibit input. An integrated watchdog monitors the connected controller. The device incorporates overvoltage protection and temperature protection that disables the circuit at overtemperature.

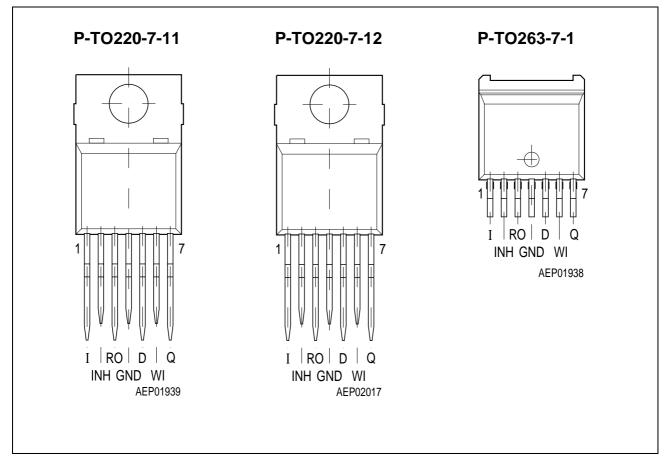

Figure 1	Pin Configuration (top view)
----------	-------------------------------------

Pin Definitions and Functions

Pin	Symbol	Function
1	Ι	Input; block to ground directly on the IC with ceramic capacitor.
2	INH	Inhibit
3	RO	Reset Output ; the open collector output is connected to the 5 V output via an integrated resistor of 30 k Ω .
4	GND	Ground
5	D	Reset Delay; connect a capacitor to ground for delay time adjustment.
6	WI	Watchdog Input
7	Q	5-V Output ; block to ground with 22 μ F capacitor, ESR < 3 Ω .

Circuit Description

The control amplifier compares a reference voltage, which is kept highly accurate by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of a series transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element.

The reset output RO is in high-state if the voltage on the delay capacitor $C_{\rm D}$ is greater or equal $V_{\rm UD}$. The delay capacitor $C_{\rm D}$ is charged with the current $I_{\rm D}$ for output voltages greater than the reset threshold $V_{\rm RT}$. If the output voltage gets lower than $V_{\rm RT}$ ('reset condition') a fast discharge of the delay capacitor $C_{\rm D}$ sets in and as soon as $V_{\rm D}$ gets lower than $V_{\rm LD}$ the reset output RO is set to low-level.

The time for the delay capacitor charge from V_{UD} to V_{LD} is the reset delay time t_D .

When the voltage on the delay capacitor has reached V_{UD} and reset was set to high, the watchdog circuit is enabled and discharges C_{D} with the constant current I_{DWD} . If there is no rising edge observed at the watchdog input, C_{D} will be discharge down to V_{LDW} , then reset output RO will be set to low and C_{D} will be charged again with the current I_{DWC} until V_{D} reaches V_{UD} and reset will be set high again.

If the watchdog pulse (rising edge at watchdog input WI) occurs during the discharge period $C_{\rm D}$ is charged again and the reset output stays high. After $V_{\rm D}$ has reached $V_{\rm UD}$, the periodical behavior starts again.

Internal protection circuits protect the IC against:

- Overload
- Overvoltage
- Overtemperature
- Reverse polarity

Application Description

The IC regulates an input voltage in the range of 6 V < $V_{\rm I}$ < 40 V to $V_{\rm Qnom}$ = 5.0 V. Up to 26 V it produces a regulated output current of more than 550 mA. Above 26 V the saveoperating-area protection allows operation up to 36 V with a regulated output current of more than 300 mA. Overvoltage protection limits operation at 42 V. The overvoltage protection hysteresis restores operation if the input voltage has dropped below 36 V. The IC can be switched off via the inhibit input, which causes the quiescent current to drop below 50 µA. A reset signal is generated for an output voltage of $V_{\rm Q}$ < 4.5 V. The watchdog circuit monitors a connected controller. If there is no positive-going edge at the watchdog input within a fixed time, the reset output is set to low. The delay for power-on reset and the maximum permitted watchdog-pulse period can be set externally with a capacitor.

Design Notes for External Components

An input capacitor $C_{\rm I}$ is necessary for compensation of line influences. The resonant circuit consisting of lead inductance and input capacitance can be damped by a resistor of approx. 1 Ω in series with $C_{\rm I}$. An output capacitor $C_{\rm Q}$ is necessary for the stability of the regulating circuit. Stability is guaranteed at values of $C_{\rm Q} \ge 22 \ \mu\text{F}$ and an ESR of < 3 Ω .

Reset Circuitry

If the output voltage decreases below 4.5 V, an external capacitor C_D on pin D will be discharged by the reset generator. If the voltage on this capacitor drops below V_{DRL} , a reset signal is generated on pin RO, i.e. reset output is set low. If the output voltage rises above the reset threshold, C_D will be charged with constant current. After the power-on-reset time the voltage on the capacitor reaches V_{DU} and the reset output will be set high again. The value of the power-on-reset time can be set within a wide range depending of the capacitance of C_D .

Reset Timing

The power-on reset delay time is defined by the charging time of an external capacitor C_d which can be calculated as follows:

$$t_D = C_D * \Delta V / I_D$$

Definitions:

 C_D = delay capacitor t_D = reset delay time I_D = charge current, typical 14 µA $\Delta V = V_{UD}$, typical 1.8 V V_{UD} = upper delay timing threshold at C_D for reset delay time

The reset reaction time t_{rr} is the time it takes the voltage regulator to set the reset out LOW after the output voltage has dropped below the reset threshold. It is typically 1 µs for delay capacitor of 47 nF. For other values for C_d the reaction time can be estimated using the following equation:

$$t_{\rm RR} \approx 20 \text{ s/F} \times C_{\rm d}$$
